
□ 1. Self-Introduction (30 seconds)

“Hi, I’m Saravana, a DevOps Engineer with around 2 years of hands-on experience in AWS, Terraform, Jenkins, Docker, and Kubernetes. I’ve worked on automating cloud infrastructure, building CI/CD pipelines, and supporting EKS-based deployments. I enjoy solving deployment issues, improving automation, and ensuring smooth delivery of applications. I’m now looking for a role where I can contribute to cloud and DevOps initiatives while continuing to grow technically.”

□ Self-Introduction (1 minute version)

“My name is Saravana, and I have about 2 years of experience as a DevOps Engineer working across AWS, GCP, Jenkins, Terraform, Docker, and Kubernetes. I’ve mainly worked on automating AWS infrastructure using Terraform modules, designing CI/CD pipelines using Jenkins and Maven, and deploying and validating applications in EC2 and EKS environments.

In my second project, I supported an internal EKS platform where I handled ingress routing, TLS setup, monitoring with Prometheus and Grafana, and troubleshooting pod and deployment issues. I also built Docker-based Jenkins agents and automated configuration steps using Ansible and Python scripts.

I enjoy automation, solving deployment challenges, and improving the efficiency of DevOps workflows. I’m now looking to contribute these skills in a more scalable production environment.”

□ 2. Why Should We Hire You? (HR-Friendly)

“You should hire me because I bring practical, hands-on DevOps experience across AWS, Terraform, Jenkins, Docker, and Kubernetes, which are key skills for this role. I’ve already worked on real CI/CD pipelines, AWS provisioning, monitoring setups, and EKS workload support, so I can contribute from day one. I’m also a quick learner, detail-oriented, and comfortable troubleshooting issues in fast-paced environments. I believe I can add value to your DevOps team by improving automation and ensuring smooth deployments.”

☐ 3. Strengths & Weaknesses (Professional & Safe)

Strengths

- Strong in automation: Terraform, Jenkins, Docker, Kubernetes
- Quick learner: Picked up EKS, monitoring stack, and IaC fast
- Good troubleshooting ability: Logs, metrics, deployment issues
- Team player: Worked closely with senior DevOps engineers
- Documentation-focused: Clear records of pipelines & infra

Example Answer:

“My strengths are strong automation skills using Terraform and Jenkins, good troubleshooting skills in Linux, Kubernetes, and cloud environments, and the ability to learn new tools quickly. I am reliable, consistent, and write clean documentation so the team can understand the workflow easily.”

Weakness (SAFE answer)

“Sometimes I focus too much on accuracy, especially while automating or writing scripts, but I’m improving by balancing speed and quality. I also used to hesitate in meetings, but working closely with seniors and taking ownership of tasks has improved my communication significantly.”

☐ NEVER mention: poor time management, stress, lack of skills.

☐ Tell Me About Your Projects – HR Version (Simple & Clear)

Project 1 – Infrastructure Automation & CI/CD

“In my first project, I worked on automating AWS infrastructure using Terraform and building CI/CD pipelines in Jenkins. I created reusable Terraform modules, automated EC2 and VPC provisioning, integrated Ansible for configuration, and helped deploy Java applications using Maven and Nexus. I also created Docker-based Jenkins agents to make builds faster and more consistent.”

Project 2 – AWS EKS Platform Support

In my second project, I supported an internal EKS environment. I handled ingress routing, TLS setup using cert-manager, monitoring setup using Prometheus, Grafana, and Loki, and troubleshooting pod and deployment issues. I also configured IRSA for secure AWS access and helped maintain the observability stack across namespaces.”

Tell Me About Your Projects – Technical Version (For Manager/Architect)

Project 1: AWS Infra Automation + CI/CD

I automated AWS infrastructure using Terraform modules for VPC, subnets, route tables, EC2, IAM roles, and security groups. I used S3 + DynamoDB for remote backend and state locking.

In Jenkins, I built pipelines for Java applications using Maven, SonarQube, Nexus, and deployment stages to EC2. I also integrated Terraform and Ansible steps into the pipeline. I created Docker-based Jenkins agents with Terraform, Ansible, Python, and AWS CLI preinstalled, ensuring consistent builds. I handled issues like Terraform state conflicts, IAM permission failures, and build errors.

Project 2: AWS EKS Platform Support

I supported an internal EKS cluster, validating ingress routing with ALB Ingress Controller, configuring TLS using cert-manager with Let's Encrypt, and implementing observability using Prometheus, Grafana, Loki, and Promtail.

I configured IRSA for Prometheus and other workloads and used EBS CSI driver for persistent volumes. I troubleshoot pod crashes, PVC pending issues, bad ingress rules, helm failures, and resource limit issues.

I contributed to improving visibility and reducing debugging time by setting up dashboards and log aggregation.”

1. “Walk Me Through Your Resume” – Perfect 2-Minute Answer

Use this **exact script** in interviews. It is crisp, confident, and matches your resume **line-by-line**.

📄 2-Minute Resume Walkthrough (Best for HR + Technical)

“Sure. My name is Saravana, and I have around 2 years of experience as a DevOps Engineer working across AWS, Terraform, Jenkins, Docker, and Kubernetes.

In my first project at Adaequare, I worked on AWS infrastructure automation.

I built reusable Terraform modules to provision VPCs, EC2, IAM roles, security groups, and S3 buckets. I implemented remote backend with S3 and DynamoDB for safe state management.

On the CI/CD side, I created and supported Jenkins pipelines using Maven, Nexus, and SonarQube for Java-based application deployments. I also built Docker-based Jenkins agents to make the pipeline executions clean and consistent.

Additionally, I wrote Bash and Python scripts for deployment validation, health checks, and log verification.

In my second project, I supported an internal AWS EKS platform for the client CODA.

My role involved validating ingress routing, LoadBalancer configurations, TLS setup using cert-manager, and ensuring microservices were reachable across namespaces.

I also deployed and validated Prometheus, Grafana, Loki, and Promtail for centralized monitoring and logging. I configured IRSA for secure access to AWS APIs and used the EBS CSI driver for dynamic volume provisioning.

I helped troubleshoot pod crashes, PVC pending issues, ingress failures, and Helm deployment issues.

Overall, my experience combines infrastructure automation, CI/CD pipeline management, Kubernetes workload support, and cloud troubleshooting. I’m now looking for a role where I can apply these skills in a production-scale environment and continue growing as a DevOps engineer.”**

□ 2. FULL MOCK INTERVIEW (HR + TECHNICAL)

This is a **real interview simulation**.

I will ask **one question at a time**.

You answer → I evaluate → I improve → next question.

Let's begin.

□ HR Round – Mock Interview

HR Q1. Tell me about yourself.

(Answer again using 30-sec intro or 1-min intro. I'll refine it.)

□ Technical Round – Mock Interview (AWS + DevOps + EKS)

As soon as HR round ends, we move to technical:

Sample upcoming questions:

1. **Explain your Terraform module structure.**
2. **How does Jenkins trigger Terraform and Ansible?**
3. **How does IRSA work in EKS?**
4. **How do you troubleshoot CrashLoopBackOff in EKS?**
5. **Explain VPC components used in your project.**
6. **How do ALB Ingress Controller and cert-manager work together?**
7. **What happens in a Terraform apply internally?**
8. **How do you do rollback in Kubernetes?**
9. **How do you secure secrets in AWS?**
10. **What was the toughest issue you solved?**
